ContentKEEPER™ Snatches Premier Global IT Security Award

“Best Content Filtering Solution” – Secure Computing Magazine

FreeStone Software of Denver, US distributor for ContentKEEPER™, today announced that ContentKEEPER™, a software solution for website content filtering and security, has received Secure Computing Magazine's Global Award 2004 as the “Best Content Filtering Solution”.

ContentKEEPER™ was selected over a field of established industry giants and numerous other nominees from across the globe in winning the award at ceremonies in London last evening. ContentKEEPER™ is a product of ContentKeeper Technologies of Canberra, Australia.

David Wigley, Managing Director, attributed the honor to ContentKEEPER's superior technology. Mr. Wigley stated that “We always knew that our collaborative approach to Web-filtering was far superior to any other solution available today. We are very pleased to receive this international industry recognition”.

ContentKEEPER™ allows organizations to monitor, manage and control staff access to the internet. Its unique, patent-pending “Closed Loop Collaborative Filtering” technology automates the worldwide collection and hourly redistribution of newly discovered non-business URLs, allowing it to provide the most current and accurate URL Control List available.

ContentKEEPER™ features a local Real-Time Blocking and Artificial Intelligence engine for analysis and reclassification of URLs not in its Control List. Combined with the Control List, the RTB/AI engine allows ContentKEEPER™ to monitor and manage BOTH incoming and outgoing internet activity vs. the outgoing-only approach of most other filtering products. Importantly, ContentKEEPER™ also effectively detects and blocks malicious code in website data streams.

ContentKEEPER is available in both Enterprise and Service Provider versions through FreeStone Software in Denver at 303-398-7016 or sales@freestonesoftware.com.
