

FOR IMMEDIATE RELEASE

May 1, 2003

FreeStone Software and ContentKeeper Technologies announce availability of "ContentKeeper SP™" An Innovative Website Content Filtering Solution for Internet Service Providers and CATV MSO's

ContentKeeper SP™ allows Service Providers to offer filtered, "family-friendly" and personalized Internet access to their subscribers without the overhead of managing thousands of individual filtering preferences. By deploying ContentKeeper SP™, Dial and High Speed Access Providers can equip their subscribers with the tools needed to self-enroll and then manage their own filtering policies, on-line and in real-time, while generating new revenues and/or improving subscriber retention.

The ContentKeeper Profile Server hosts Filter Profile Webpages that are accessed by authorized subscribers to enroll and set up or modify the filtering policies for their account; as well as any other accounts over which they have control e.g. parents can control family members' access.

Filtering policies allow the blocking of website addresses in some twenty-six different categories, time-of-day control of access (on a per account / sub-account basis) and the customized treatment of up to 500 URLs per individual account, all under password protected access.

When subscribers authenticate, their Authentication / Authorization data and assigned IP address are forwarded to the ContentKeeper Profile Server. The Profile Server retrieves the subscriber's Filtering Profile from its database and forwards it to the ContentKeeper Filtering Server where personalized filtering is applied to web traffic on a real-time basis.

"ContentKeeper SP provides significant advantages to all Service Providers interested in offering filtered Internet access to their subscriber base. By simply plugging servers into their existing network, Service Providers can immediately implement filtering and begin generating new revenues; without the administrative overhead and subscriber interactions associated with other alternatives" states David Wigley, Managing Director of ContentKeeper Technologies. "The system is virtually self-actuating and self-managing!" says Dave Gonnion, owner of FreeStone Software, the US distributor of ContentKeeper SP.

ContentKeeper SP runs under Red Hat Linux v7.3 or later and can be configured to support from 1000 to more than a 100,000 subscribers. It is available now on both a royalty and annual Subscriber Base License basis from FreeStone Software.

ContentKeeper SP is the Service Provider version of ContentKeeper ES™, the award winning content filtering solution for Enterprise, Government and Academic organizations. ContentKeeper ES™ was awarded the "Best Enterprise Software" at Networld+Interop, March 2002 and was also recently recognized with 4 Golden Globes by PCWorld magazine.
